Thought of the week

Recent tariffs are delivering on at least one promise — making the government richer. As the chart of the week shows, net federal tariff revenue reached \$60 billion in the first five months of the year, nearly double the same period in 2024. Much of this windfall came in April and May, following sweeping tariff hikes: a baseline 10% on nearly all imports, plus higher rates on select sectors and countries. Yet the bigger economic question — one the Fed is closely watching — is who is ultimately paying these tariffs.

Data released last week showed that U.S. import prices ex-fuel rose 0.3% in May and are up 0.8% year-to-date. These prices are calculated before tariffs. If foreign producers were truly "eating the tariffs," prices would have fallen — roughly by the increased tariff rate — to offset higher costs U.S. importers are facing. The modest increase instead suggests that foreign suppliers are holding firm — with little indication of this changing anytime soon. With a nearly 7% decline in the trade-weighted dollar this year, foreign businesses are already earning fewer euros, yen or local currencies per dollar — limiting both their ability and incentive to provide discounts. As a result, U.S. businesses and consumers are now on the hook — through tighter margins today, and likely reduced purchasing power ahead.

With the Fed projecting weaker growth yet in no rush to cut rates, monetary stimulus remains distant. Against this backdrop, stretched U.S. equity valuations and looming margin pressures leave limited room for upside. Therefore, investors would be wise to look beyond familiar shores — to regions like the eurozone, which leads in earnings revisions while still trading at a steep discount.
