

Product Brief

AT&T Premises-Based Firewall Service

Managed security for Small Businesses

The surge in Internet, Intranet and Extranet technologies has provided users the convenience of connecting into a standards-based protocol network to transmit data or access applications. The widespread adoption of these technologies has also given rise to security threats and the ability to eavesdrop, impersonate, infiltrate networks and distribute computer viruses. To help detect and mitigate these risks, firewalls and unified threat management devices have

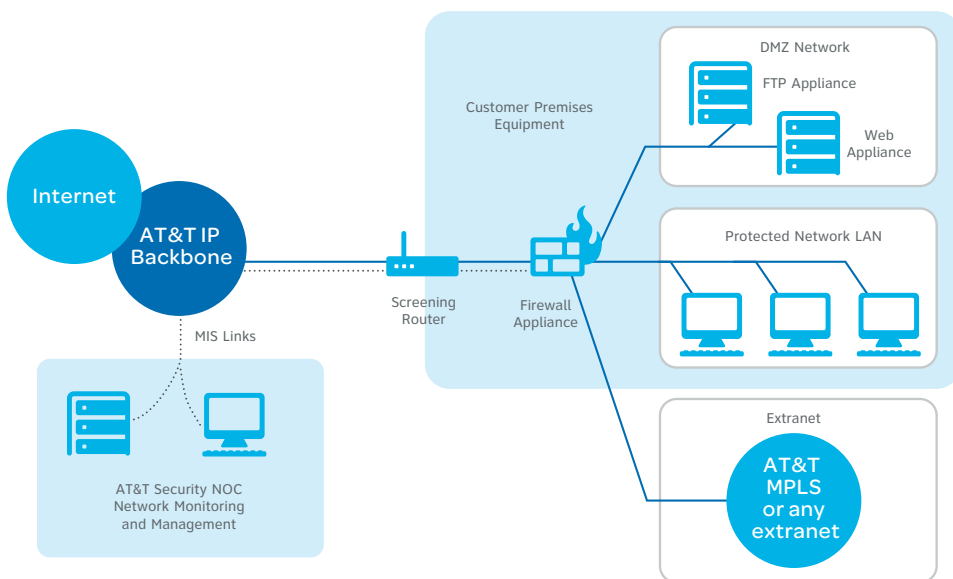

become an important part of any corporate security program, and should be looked upon as the foundation of internetwork security.

AT&T Premises-Based Firewall Service provides an additional layer of security to your company's network. For Small Business customers or locations, we can provide a fully managed single firewall that supports DMZ, Extranet and VPN connectivity options using a Fortinet appliance solution.

Potential Benefits

- Fully managed end-to-end solution designed to help increase your network's security
- May reduce your capital investments, staffing and maintenance expenses
- An agile security solution that can scale at the same rate as your business

AT&T Premises-Based Firewall Solutions

Features

- Security reporting
- Stateful inspection
- DMZ and Extranet support
- Client-to-site and site-to-site VPN connectivity options
- UTM options (intrusion prevention and web filtering)
- Helps provide a better secured environment to companies who need to support an unlimited number of concurrent user sessions

AT&T State-of-the-Art Security Network Operations Center (S/NOC)

The firewalls are actively managed and monitored by AT&T security professionals based on your unique network security policy. Security event logs are sent to the S/NOC for further analysis and alerting.
