

ADVANCED REGULATORY CONTROL (ARC) FOR ETHANOL PLANTS

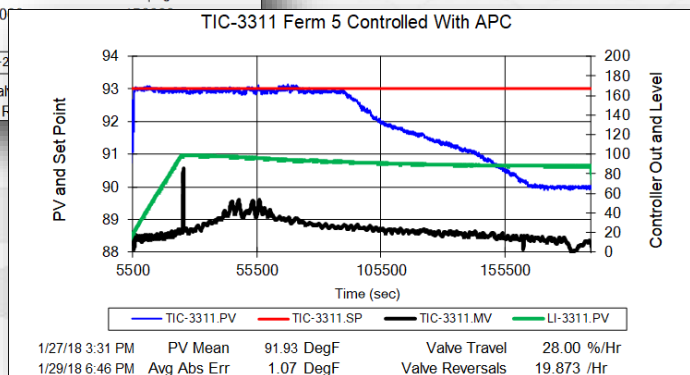

FERMENTATION

- Model Based Tuning
- Ramped Set Point (SP) Staging
- Adaptive Tuning
 - Level < 20%, control via cooler outlet temperature
 - Level > 20%, control via fermenter temperature
- CWS and CCS Management with Chiller Demand Constraint Control
 - Currently seeking a Beta Site

Fermenter temperature control with OpX ARC

ARC is a fraction of the cost of the APC

Control with APC

Note: Actual Setpoint unavailable for APC fermenter control.

DISTILLATION

- Currently seeking a Beta Site

FRONT-END

- Model Based Tuning
- Slurry Density Control
 - Percent Backset Ratio/Cascade
 - Slurry Solids (Density) Cascade to Total Cook Water
 - Thin Stillage Inventory (Tank Level) Manipulate Percent of Backset Flow to Slurry
- Corn Milling
 - Mill Balancing & Operator Bias Control Balances Load During Maintenance Allows Operator Input to 'Push' Mills Harder
 - Fermenter Gap (Inventory) Control Manipulates Mill Feeds (with Mill Amps Constraint)
- Water Balance
- Cook Water Tank Inventory (Level) Control Cascade to CO2 Scrubber Flow(s) Bias Input to Meet Lower Limits per Scrubber Low Level Control Admits Fresh Water

DRYER/ENERGY CENTER

- Model Based Tuning
- Cascade Dryer Temperature to Gas Flow Control
- Dryer Inlet (Combustion) Temperature Constraint Control
- Predictive Control
 - Centrifuge Feed (Front End Dryers), Syrup (Back End Dryers)
- Soft Sensors (DDGS Moisture)
 - Future
