

Building Business Opportunities with Distributed Applications

Hosted by:  **101 Blockchains**

Enrico Camerinelli
VP Research, 101 Blockchains

Bernhard Elsner
Product Lead DAML, Digital Asset

101 Blockchains is the world's leading **enterprise blockchain research and training provider**. Our community is empowering the profession of **Enterprise Blockchain Management**.

WHAT WE DO

At 101 Blockchains **we don't sell blockchain**. We help corporate executives understand and decide how the technology fulfills their business needs and objectives.

Webinar Topics

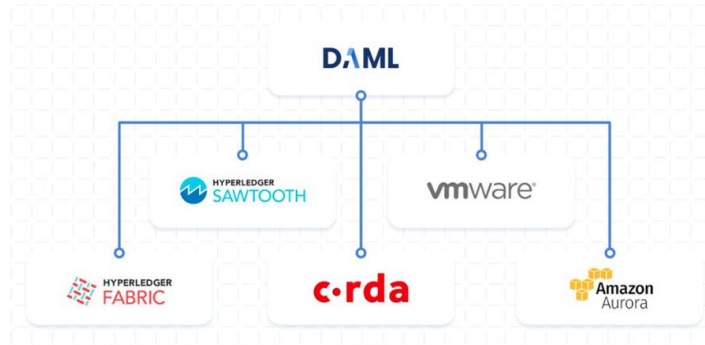

- Distributed Applications Value
- “Non-traditional” use-cases
- De-risking Blockchain

Use the **Q&A** feature to ask your questions

A few
housekeeping
tips

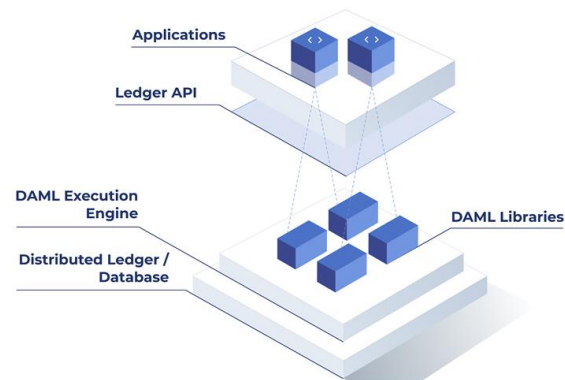

DAML : Distributed Applications in days not years

Write once, deploy anywhere

DLT, Blockchains, Crypto Databases, RDBs

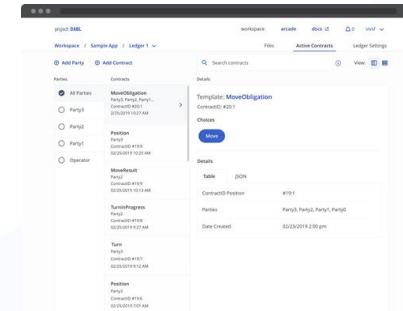

Developer Focussed

Tooling for complete full-stack applications.

Scales from PoC to national infrastructure

Open Source, Backed by global innovation leaders

project: **DABL**

Get to market first, stay there longer

Cheap, fast, complete application platforms

What's a distributed application?

Distributed in terms of

Infrastructure

Trust

Control

Knowledge

Every Large Application

Messengers with E2E encryption

Distributed Social Networks

P2P Messaging

Blockchain's great contributions are **consistency and integrity**

Smart Contracts' great contribution is a **shared understanding** of the system.

Example: Digital Money

The original Blockchain app

- High Value
- Distributed in most respects
- Consistency is crucial
- Simple
 - The state is a fixed (or controlled) quantity allocated to addresses
 - A state transition is a quantity preserving change to the allocation
 - Everything else is there to enable infrastructure and security

5112

Carbon Copies

on CoinMarketCap, Feb 12th 2020

Why?

847

Infrastructures

on CoinMarketCap, Feb 12th 2020
Based on the number of Coins

Cost

vs

Value

Application Logic

Value creation takes only a small fraction of the overall effort

Boilerplate

Developing apps using system-level programming is slow, and error prone

TechOps

Deploying, and maintaining infrastructure is a major cost

Infrastructure

Building an enterprise grade distributed ledger infrastructure takes years and costs millions

Historic parallels

1960s

Image Credit: NASA

1990s

Image Credit: Museum s Victoria

2020s

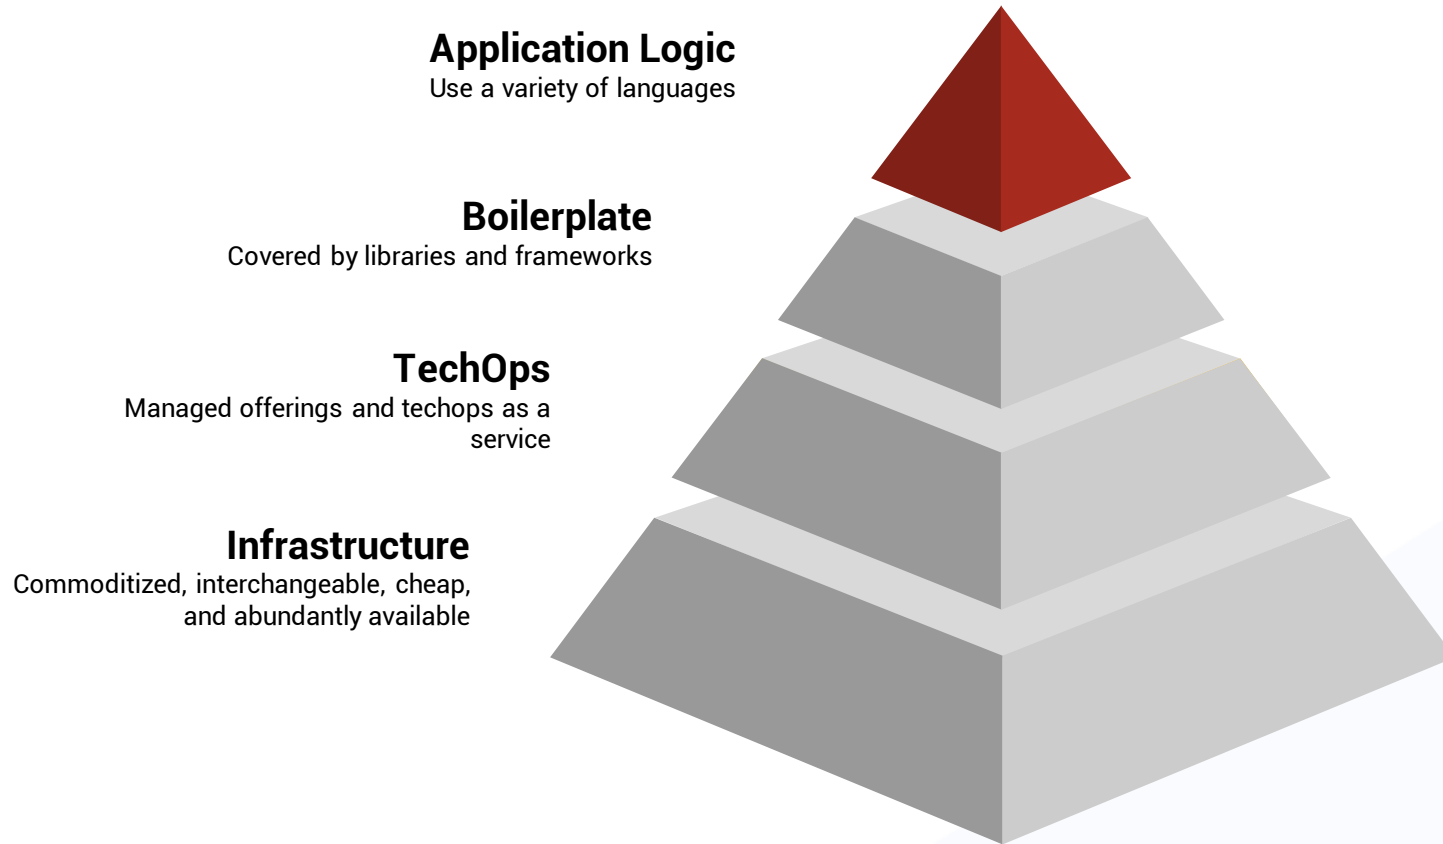

Image Credit: Pixabay

Putting value first needs abstractions

It requires confidence that the foundation can follow later

Full-Stack apps in minutes
PoCs in days

Established practices
CI/CD as standard
Containerisation

No early commitment
Low risk of lockin
Managed offerings

A silly example? Kanban

- Medium high value - Market leader ~\$425M
- Typically centralised
- Privacy more important than consistency
- Some complexity

Image Credit: Jeff Lasovski. Modified by Opensource.com . CC BY-SA 3.0.

What's the business model of distributed Kanban?

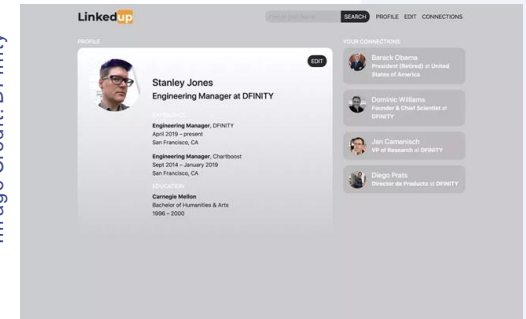

We won't find out if it costs millions to get it into production.

Example II: Social Networks

- Very high value
- *Fee*/distributed
- Highly centralised business models
- There's interest in decentralised models
 - Common *rules* and *data ownership* at the core
 - New Business Models around cryptocurrencies

Image Credit: DFINITY

jack 🌍🌍🌍🌍 @jack

Twitter is funding a small independent team of up to five open source architects, engineers, and designers to develop an open and decentralized standard for social media. The goal is for Twitter to ultimately be a client of this standard. 🇺🇸

Image Credit: Twitter

**Is Blockchain the
right
infrastructure for
Social Media?**

**Are the business
models driving
the infrastructure
or vice versa?**

Distributed Applications need *Agile*

Image Credit: Lakeworks/Wikipedia

Test a product hypothesis with minimal resources

Need to choose and lock into expensive infra first

Deliver a complete product to customers

Ecosystems focussed on infrastructure and smart contracts only

Iterate quickly and do regular releases

Blockchain applications are notoriously hard to upgrade

=

=

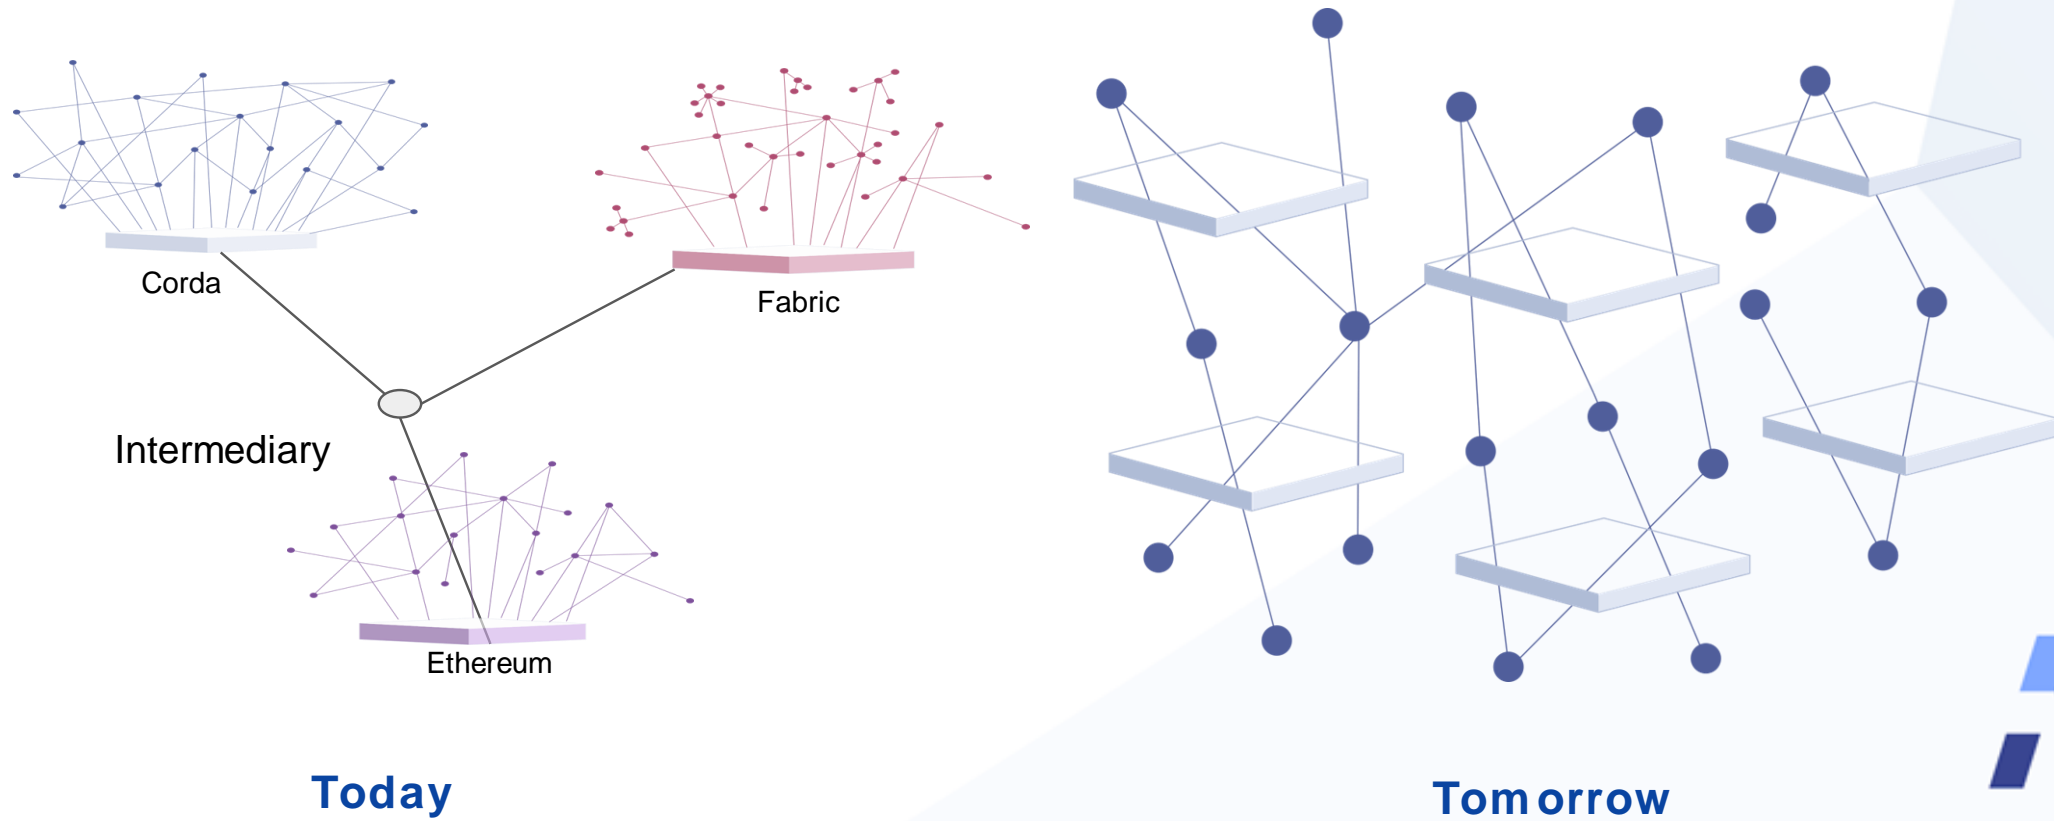

Minimize overall risk and adapt quickly

Risk

What's next?

Abstracting infrastructure is only part of the story for Distributed Applications

Use the **Q&A** feature to ask your questions
