

## Microsoft Teams post: Glaring issue, containers targeted for servers cannot build on Azure DevOps, agents must be made current

Why?

This pretty much (without agent work) means you cannot deploy for the MOST CURRENT Windows Server OS ... it seems the rev. levels of the agent are lower, much lower.

This is a minimum requirement for a tool, like Azure DevOps to be considered a usable service. (ie; I wouldn't pay for that kind of internal incompatibility. I can't build for your most current platform, by default !!?? What?)

Something to consider.
