Disclosures

• Financial Disclosures:
  – I am employed by the Vanderbilt University Medical Center.

• Non-financial Disclosures:
  – None
What is fatigue?

- No universal definition

- **Physical fatigue**: reduced ability or desire to perform some physical task

- **Cognitive/mental fatigue**: a mood; state of decreased optimal performance due to sustained cognitive demands; feeling of exhaustion

- **Emotional fatigue**: reduced ability or desire to perform tasks due to emotional or psychological demands

Stress also associated with difficult listening; overlapping construct with fatigue.

Hornsby, Naylor, & Bess, 2016
Measuring Fatigue

• Subjectively: fatigue as a mood state or feeling
  – Feelings of tiredness, lack of vigor or energy, decreased motivation to complete a task (Tiesinga et al., 1996; Cahudhuri & Behan, 2000)
  – Sustained effort to complete a task, emotional distress, sleep disturbances
  – Cognitive: difficulties with concentration, attention, clear thinking, and memory (Chalder et al., 1993; Stein et al. 2004)

• Behaviorally: fatigue noted as a performance decrement
  – Mixed results
  – “cognitive fatigue”: decrement in performance related to fatigue during mental tasks (Ackerman, 2011)
Negative Consequences of Fatigue

- Reduced efficiency at work
- Accidents in the workplace
- Decline in attention or cognitive processing
- Impaired judgement
- Slowed reaction time
- Decline in motivation
- Association with depression
- Mental distress (Kramer, 2006)
Aren’t we all fatigued?

Fatigue is one of the most common complaints reported in primary care settings

- Transient fatigue is common, even in healthy populations
- https://www.youtube.com/watch?v=POKDDleedCY

Recurrent, severe fatigue

- **Uncommon** in healthy populations, but common in many chronic health conditions
  - Previous reports in individuals with cancer, HIV/AIDS, Parkinson’s, Multiple Sclerosis
  - Very little work looking at fatigue and hearing loss, especially for children
Prevalence of Fatigue

• 18-38% of adults
• 4% of children and adolescents
• Higher rates following puberty
• More common in females
• More common in lower socioeconomic groups
• More severe in those with chronic conditions
LISTENING FATIGUE

“I went to a great conference today. It was riveting and I was hooked on pretty much every word. And then I got home and collapsed on the sofa. I’ve had to turn my ears off to rest in silence and my eyes are burning.

..the impact of deafness doesn’t just manifest itself in communication. It’s about the energy involved in lipreading and being attentive all day long.

When I was younger, I was a little embarrassed to be so tired all the time. I would force myself to go out and be busy and out there when really all I wanted to do was crawl under the sofa and nap for a hundred years. Nobody ever really told me that being tired was “okay’.

of something intelligent to say in response to an invariably random question.

It’s like doing jigsaws, Sudoku, and Scrabble all at the same time.”
Negative Consequences of Fatigue

• Metal plant workers with hearing loss
  – Difficulty understanding speech and reduced awareness of environemental sounds
  – To compensate, reports of increased attention, concentration and effort at work
  – Lead to reports of increased stress, tension and fatigue
    • ”too tired for normal activities”
  – Rate of sick leave for AHL four times greater

Hetu et al, 1988; Kramer et al, 2006
Negative Consequences of Fatigue

- Reduced academic performance
- Increased school absences
- Inability to engage in usual daily activities
- Sleep disturbances
- Changes in social relationships
- Negative change in life quality
What contributes to listening-related fatigue?

- Listening in the classroom
- Increased listening effort
- Decline in top-down processing resources
- Stress
- Fatigue

Bess & Hornsby, 2013
Negative Consequences of Fatigue

- Listening in the classroom
- Increased listening effort
- Decline in top-down processing resources
- Stress
- Fatigue
- Degraded cognitive processing
- Disengagement
- Learning skills compromised
- Decline in school performance

Bess & Hornsby, 2013
1. Listening in the Classroom
Listening Effort Example

- [https://www.youtube.com/watch?v=mYt6-Soa9I](https://www.youtube.com/watch?v=mYt6-Soa9I)
- [https://www.youtube.com/watch?v=w5RMjmdj-CE&t=27s](https://www.youtube.com/watch?v=w5RMjmdj-CE&t=27s)

- What would you like on the menu?
Device Use in the Classroom

Hearing Aid Use
- Consistent: 66% (n=25)
- Variable: 24% (n=9)
- Non-user: 10% (n=4)

Children with less hearing loss, and those in higher grades (5th-7th) were less likely to use hearing aids in the classroom.

FM System Use
- Consistent: 12% (n=3)
- Variable: 42% (n=11)
- Non-user: 46% (n=12)

FM system available?
- 89% of 1st - 4th graders
- 47% of 5th - 7th graders

Davis et al., 2015; Gustafson et al., 2015
What contributes to listening-related fatigue?

- Listening in the classroom
- Increased listening effort
- Decline in top-down processing resources
- Stress
- Fatigue

High Noise Levels + Inconsistent Use of Technology

Bess & Hornsby, 2013
Study Participant Demographics

- **Participants**
  - CNH and CHL (6-12 years old)
  - Parents
    - Bilateral, mild to moderately-severe SNHL
    - No CI users
    - No diagnosis of developmental disorder or cognitive impairment

- **Experimental (CHL) group (n=60)**
  - 31 males (52%), 29 females
  - Age = 10.0 (1.9) years

- **Control (CNH) Group (n=43)**
  - 26 males (60%), 17 females
  - Age = 9.1 (2.3) years
What is listening effort?

• Allocation of attentional and cognitive resources toward auditory tasks.
  – Detecting, decoding, processing and understanding spoken messages or other auditory signals

• CHL and AHL must increase mental effort compared to those without HL when attempting to detect, process, and respond to auditory stimuli (Hicks and Tharpe, 2002; McCoy et al., 2005)
  – Increase in **LISTENING EFFORT** (Hornsby, 2013; Bess & Hornsby, 2014; McGarrigle et al., 2014)
Does effortful listening affect CHL?

“Effortfulness Hypothesis”

Consequences: listening effort, stress, and fatigue

COGNITIVE RESOURCES

EFFORTFUL LISTENING IN DIFFICULT SITUATION

RESOURCES LEFT FOR OTHER PROCESSING NEEDS
(memorization, comprehension)
Factors Influencing Listening Effort

Should I put forth effort to listen?

- Classroom acoustics
- Motivation
- Classroom distractions
- Cognitive processing abilities
2. Assessing Listening Effort

Primary task: Word Recognition
Secondary task: Visual Reaction Time

Three SNRs ranging from -4 to +12 dB in multi-talker babble
Assessing Listening Effort: Vocal Response Time

Say the word....

“ride”

VRT = time delay between speech stimulus and spoken response

EASY

............... “ride”

HARD

.................................... “ride”
Children with hearing loss showed longer VRT compared to children with normal hearing ($p<.001$).

Children with hearing loss demonstrate greater listening effort when listening to speech in noise and reverberation.

Task: word recognition in -4 to +12 dB SNR

McGarrigle, Gustafson, Hornsby, & Bess, in preparation; Figure from Gustafson, 2017
What contributes to listening-related fatigue?

Listening in the classroom → Increased listening effort → Decline in top-down processing resources → Stress → Fatigue

High Noise Levels + Inconsistent Use of Technology

Lab: Vocal Response Times (McGarrigle et al, in prep)

Bess & Hornsby, 2013
3. Measuring ERP

Event-related potentials (ERP) are changes in ongoing EEG activity that are time-locked to the onset of the auditory event

- Reflects change in brain activity associated with the processing of that stimulus

Centro-parietal P300 response

- Sensitive to fatigue due to cognitive processing (Murata, Uetake, & Takasawa, 2005; Uetake & Murata, 2000)
Assessing Fatigue in the Lab

3 hours

ERP 1 → Speech Processing Tasks → ERP 2

Event-Related Potentials

- Blue: Standard
- Red: Target

Gustafson, 2015
Children with hearing loss show delays in cognitive processing when compared to children with no hearing loss.

Gustafson et al., in preparation
Change in Processing Resources: *Children with Hearing Loss*

Trend for cognitive processing to be reduced following sustained speech-processing tasks ($p=.078$).

Gustafson et al., in preparation
What contributes to listening-related fatigue?

- Listening in the classroom
- Increased listening effort
- Decline in top-down processing resources
- Stress
- Fatigue

High Noise Levels + Inconsistent Use of Technology

Lab: Vocal Response Times (McGarrigle et al, in prep)

Lab: P300 Response (see Key et al, 2017)

Bess & Hornsby, 2013
Stress, Cortisol, and Fatigue

• Stress is the body’s reaction to change that requires a physical, mental, or emotional response
  – Stress is caused by good and bad experiences

• **Cortisol** levels provide a physiologic measure of stress
  – Regulated by the hypothalamic-pituitary-adrenal (HPA) axis
  – Related to sugar levels in the blood that fluctuate based on the need to mobilize energy
In non-fatigued individuals, cortisol levels have a typical diurnal pattern

- Build-up of cortisol during sleep
- Rapid rise upon awakening
  - Cortisol Awakening Response; CAR
- Slow decline in cortisol throughout the day

“Atypical” Cortisol Patterns

- Sustained stress or fatigue can lead to abnormal diurnal cortisol patterns
  - Reduced response with “Chronic Fatigue Syndrome”

Slide from Gustafson, 2015
“Atypical” Cortisol Patterns

- Sustained stress or fatigue can lead to abnormal diurnal cortisol patterns
  - “Elevated” CAR in patients with depression

Slide from Gustafson, 2015
4. Cortisol Measurement

- **Participants**
  - Children with hearing Loss (n=32)
  - Control group (n=28)

- **Six samples per day**
  1. Awakening*
  2. 30 min post-wake up*
  3. 60 min post-wake up*
  4. 10:00 am
  5. 2:00 pm
  6. 8:00 pm*

- **Sampled on two separate school days**

*Samples taken by parents at home

Bess et al., (2015)
Comparing Measured Cortisol Levels

Modeling analysis revealed significant differences between group slopes – differences localized to the morning.

Bess et al., (2015)
Comparing Measured Cortisol Levels

- Children with hearing loss have higher cortisol levels at awakening than controls.
- Children with hearing loss have a reduced CAR compared to controls.
- Suggests children with hearing loss are experiencing perceived stress and an increased burden of worrying about the upcoming day.

High workload, job strain, and burnout symptoms

Bess et al. (2015)
What contributes to listening-related fatigue?

- Listening in the classroom
- Increased listening effort
- Decline in top-down processing resources
- Stress
- Fatigue

- High Noise Levels + Inconsistent Use of Technology
- Lab: Vocal Response Times (McGarrigle et al., in prep)
- Lab: P300 Response (Key et al., 2017)
- School & Home: Salivary Cortisol Samples (Bess et al., 2016)

Bess & Hornsby, 2013
“When you are hard of hearing you struggle to hear; when you struggle to hear you get tired; when you get tired you get frustrated; when you get frustrated you get bored; when you get bored you quit.” (Pichora-Fuller, 2003)
Subjective Measures of Fatigue

• Subjective measures include surveys, rating scales, and questionnaires that ask about mood or feelings.
  – Uni-dimensional: assess “general” fatigue (composite score)
  – Multi-dimensional: assess various dimensions fatigue

Several scales exist to measure multiple domains of fatigue, but none are validated measures specific for hearing loss

(Curcio, Ferrara, & De Gennaro, 2006; Hockenberry-Eaton et al., 1999; Nagane, 2004; Ravid, Afek, Suraiya, Shahar, & Pillar, 2009a, 2009b; Stoff, Bacon, & White, 1989)
Subjective Measures Study Questions

– Is subjective fatigue a problem for children with hearing loss?
  • Measure using validated measures
  • See Hornsby & Naylor, 2016 for review of subjective fatigue in adults
– If so, what factors affect their levels of fatigue?
Measuring Subjective Fatigue

PedsQL
Multidimensional Fatigue Scale

Varni et al., 2002  

5-7 year old version
Subjective fatigue in CHL

- More Fatigue

Mean child report- Full data set

~2-9 point differences for child data

• Current data shows main effect of HL, but small effect. Why?
CNH and CHL PedsQL Reports

CNH reported higher fatigue compared to other control groups.
CHL reported more, or similar, fatigue across multiple domains when compared to other control groups AND children with other chronic conditions.
More HL = More Fatigue?

No association between degree of hearing loss and self-reported fatigue

\[ r = -0.117 \]
\[ p = 0.382 \]

Hornsby, 2016
Parent versus Child Fatigue Report

Mean data collapsed across HL/NH groups

**Parent** reports generally suggest less fatigue than **child** reports

- No interaction with HL group

**More Fatigue**

- **-0.5-15 point differences!**

---

**CAN WE USE PARENT REPORT?**

**ON PEDSQL, NO!**

- No interaction with HL group
Need for Hearing Loss Specific Fatigue Scale

- No significant differences noted between CHL and CNH on overall scores for PedsQL MFS.
- Fatigue is a subjective experience
  - Inter-subject and inter-group variability

What was the PedsQL measuring?
How do you quantify fatigue?
Listening-Related Fatigue Scales: Current Work

• Vanderbilt Fatigue Scale-AHL (Adults with Hearing Loss)
• Vanderbilt Fatigue Scale-CHL (Children with Hearing Loss)
  – Pediatric Version
  – Caregiver Version
  – Teacher/Service Provider Version

**GOAL**: create and validate a measure of fatigue in individuals with hearing loss with specific listening-related questions.
Fatigue Scale Development Process

• Phase 1: Defining listening-related fatigue and issues
  – Literature Review: background theory and constructs
  – Focus Groups: individual experiences

• Phase 1B: Item Development and Revisions
  – Focus group data review
  – Expert review
  – Cognitive interviews
    • AHL, CHL, parents, and teachers

• Phase 2: Initial Psychometric Evaluation
  – Adults only, child version in progress

We need your help, so stay tuned!
Dimensions of Subjective Fatigue

- Fatigue dimensions and related constructs identified via literature review, surveys, interviews, and focus groups.
Focus Group Process

- Focus groups and individual interviews with parents, teachers, and children with hearing loss
- Transcribed and reviewed the focus group discussions
- Items written directly from quotes

What do adults with HL have to say?
Phase 1: Defining the Issues-CHL

• “Fatigue sounds like phantom, so maybe a squid?”
Phase 1: Defining the Issues-CHL

Listening-Related Fatigue

“...for me I feel more focused when there's a one-on-one conversation and I feel kind of more talkative when there's just a one on one conversation. But when there's a lot of friends...that makes me more tired. Trying to focus on conversations and then trying to think about it and process it makes me a little tired.”

–teen with bilateral cochlear implants

“In the cafeteria, they try to listen but that's their starting time of “fading down” so they just kind of take it a break time. I've had my one student, she sometimes just takes her implant off and even turns the volume down on her hearing aid and that's like her time to just sit and not have to listen.”

–Deaf education teacher

“Yeah, you wanna give up. You just don't want to try anymore because you know you won't actually get what they're trying to say or sometimes you think it's just you. Maybe I need to try a little harder to listen but when you do try, you put all of your focus on what they're trying to say and you still can't hear them.”

–Teen with bilateral hearing aids

“Yesterday we took a field trip - explored a museum. The gentleman was great, but he spoke so fast—she was still missing stuff. In a very hectic environment, and if things go really, really quick for her, I can tell her it's a lot for her. She has to make an effort, and it wears her out.”

–Parent of a 10-year old with bilateral hearing loss
## Phase 2: Item Development

Small Group Discussion

• Do you note listening-related fatigue in your students with hearing loss?
  – If so, what symptoms are observed?
Small Group Discussion

• If your student with hearing loss shows signs of fatigue, what does he/she do to cope?
• What are strategies/modifications/goals the classroom teacher, SLP, deaf educator, educational audiologist, etc. can use to help the student with hearing loss dealing with fatigue in the educational setting?
# Suggestions for IEPs

## ACCOMMODATIONS/MODIFICATIONS

<table>
<thead>
<tr>
<th>Suggestion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide notes ahead of class time to reduce need to multi-task during lecture/discussion</td>
</tr>
<tr>
<td>Provide a space and/or scheduled break time for listening/quiet breaks</td>
</tr>
<tr>
<td>Consider schedule of day and timing of auditory tasks, including therapies or other pull-out sessions</td>
</tr>
<tr>
<td>Consistent personal amplification and FM system use</td>
</tr>
<tr>
<td>Preferential seating to potentially reduce listening effort</td>
</tr>
<tr>
<td>Visual information available in the classroom</td>
</tr>
<tr>
<td>Classroom acoustic modifications</td>
</tr>
</tbody>
</table>

## ADDITIONAL SUGGESTIONS?
Conclusions

– CHL demonstrate increased listening effort when listening in noise and reverberation
  • Even with hearing aids
– CHL report more cognitive fatigue than their normal-hearing peers and similar or more fatigue than children with other chronic illnesses
– CHL show atypical markers of perceived stress, a precursor to fatigue

– There is a need for specific subjective fatigue measures for this population in order to identify CHL struggling with fatigue (and to intervene)
Phase 3: Initial Psychometric Testing

VFS-AHL: Preliminary Data

Hornsby et al., 2017 (data presented at the ARC conference, Indianapolis, IN)
Implications for Practice

Be on the lookout for fatigue!

*Fatigue can manifest itself in a variety of ways:*

- tiredness
- sleepiness in the morning
- inattentiveness and distractibility
- mood changes (irritability, frustration, etc.)
- changes in classroom contributions
- difficulty following instructions
Next Steps: Phase 2

The Vanderbilt Fatigue Scale – *Children with Hearing Loss* is in Phase 2. This version has parent, teacher, and child components.

If you’re interested in helping to distribute this scale to children with hearing loss, parents, and teachers during the validation stage, please provide your contact information on the page provided.

If you have questions specifically related to these fatigue scales, please contact the study coordinator, Dr. Hilary Davis at Hilary.Davis@vanderbilt.edu
Vanderbilt Fatigue Scale: Children with Hearing Loss

Lustig and Steve Olson, Rapporteurs; Forum on Aging, Disability, and Independence; Board on Health Sciences Policy; Division on Behavioral and Social Sciences and Education; Institute of Medicine; National Research Council. Hearing Loss and Healthy Aging: Workshop Summary.

Phase 2: Item Development

My child complains of frequent headaches.
My child struggles to understand audio from computers.
It is difficult for my child to focus with competing background noise.

My child struggles to keep up with fast-paced conversation.
My child puts a lot of effort into keeping up with conversation.
My child must make an effort to keep up with fast-paced conversation.
My child gets worn out from the effort of keeping up with conversation.

My child’s hearing difficulties impact his ability to interact with others.
My child becomes tired in noisy situations.
My child gives up trying to listen in noisy places.
No difference in word recognition performance between single- and dual-tasks.

Longer response times measured with addition of second task.

Cognitive resources were allocated toward maintaining word recognition performance in the dual-task condition.
Factors Influencing Fatigue in CHL

• What factors may modulate fatigue in CHL?
  – Hearing loss?
    • No

• Results varied with domain
  – General and Sleep/Rest: No associations with any measure
  – Cognitive and overall: significant association with CELF and PPVT (but not TONI)
Study Participant Demographics

- **Participants**
  - CNH and CHL (6-12 years old)
  - Parents
    - Bilateral, mild to moderately-severe SNHL
    - No CI users
    - No diagnosis of developmental disorder or cognitive impairment

- **Experimental (CHL) group (n=60)**
  - 31 males (52%), 29 females
  - Age = 10.0 (1.9) years

- **Control (CNH) Group (n=43)**
  - 26 males (60%), 17 females
  - Age = 9.1 (2.3) years
Measured Cortisol Levels

### Phase 2: Item Development
#### Multi-Dimensional Construct Map-CHL

<table>
<thead>
<tr>
<th>Level</th>
<th>D1: Social-Emotional</th>
<th>D2: Cognitive</th>
<th>D3: Physical</th>
</tr>
</thead>
</table>
| **3-Severe Fatigue** | - Behaviors: Becomes extremely sad, upset, angered, stressed and/or emotionally exhausted by listening difficulties /fatigue. May throw tantrums and exhibit aggression. Social life is severely impacted by listening fatigue. Exhibits avoidance behaviors isolates oneself from social gatherings to cope with listening fatigue.  
  **Situations:** Across a wide range of easy-challenging listening situations | - Behaviors: Becomes unwilling /unable to maintain effort and attention when completing even routine mental activities. Becomes very unfocused and/or consciously decides to disengage (e.g., shuts down, gives up).  
  **Situations:** Across a wide range of easy-challenging listening situations | - Behaviors: Feels exhausted, drained and/or worn out from listening. Requires naps, additional sleep, and/or silent time to recover from listening fatigue. Regular breaks need to be scheduled into school day. Reports of significant sleep problems. Reports significant headache problems. Reports need to remove hearing device.  
  **Situations:** Across a wide range of easy-challenging listening situations |
| **2-Moderate Fatigue** | - Behaviors: Becomes stressed, sad, frustrated, upset and/or emotionally tired by listening difficulties/fatigue. Social life is moderately impacted by listening fatigue. May avoid and/or withdraw from certain social gatherings.  
  **Situations:** Moderately-challenging listening situations or worse | - Behaviors: Must apply substantial mental effort to overcome difficulties remaining attentive when listening and following conversations. May tune/zone out. May need prompting.  
  **Situations:** Moderately-challenging listening situations or worse | - Behaviors: Feels tired after listening. May take listening breaks to recover. May get headaches from listening. May show abnormal sleep habits/patterns. May turn down hearing device.  
  **Situations:** Moderately-challenging listening situations or worse |
| **1-Mild Fatigue** | - Behaviors: Becomes irritated, embarrassed or anxious from listening difficulties/fatigue. Social life is mildly impacted by listening fatigue. May avoid and/or withdraw from certain social gatherings.  
  **Situations:** Very challenging listening situations only | - Behaviors: Some difficulty following fast-paced conversations and remaining attentive.  
  **Situations:** Very challenging listening situations only | - Behaviors: May exhibit mild tiredness after listening. Would enjoy a short rest or a listening break (not a requirement).  
  **Situations:** Very challenging listening situations only |
Cognitive processing was reduced following sustained speech-processing tasks ($p<.05$).

Key, Gustafson, Rentmeester, Hornsby, & Bess, 2017
Who’s at Risk? CNHL

For children with no hearing loss, **younger children** were more likely to show reductions in cognitive processing due to speech-processing related fatigue \( (p < .05) \).

Neither language or nonverbal intelligence significantly related with cognitive processing changes following sustained speech processing.
Take Home Points: CHL and Fatigue

• School-age children with mild-moderately severe HL
  – Report more fatigue, especially cognitive fatigue, compared to control groups
  – Their fatigue is comparable, or greater, than that reported by children with other chronic health conditions
• Higher fatigue ratings are
  – Are not modulated by degree of hearing loss
  – But are associated with poor language abilities (CELF scores), in both CHL and CNH
• Parent and child report, using a generic scale, provides distinct information
Poorer Language Scores = More Fatigue?

- Similar, but weaker, correlations seen for
  - CELF and Overall fatigue ($r=0.271$, $p=0.04$)
  - PPVT and Cognitive fatigue ($r=0.270$, $p=0.038$)
- No other associations noted
Assessing Listening Effort: *Vocal Response Time*

- Moderately reverberant environment  
  - average RT60 ~450 ms
- Multi-talker babble presented at 56 dB SPL from four loud-speakers around the listener
- Consonant- vowel- consonant words
- Three conditions, ranging from -4 to +12 dB SNR

Boothroyd, 2008
**PedsQL Findings**

- CHL reported significantly more fatigue across domains

**Limitations:**
- Small sample size (n=10)
- Wide range of hearing loss and amplification
  - 4 symmetric, mild to moderate SNHL with bilateral hearing aids
  - 2 asymmetric losses; unilateral hearing aids
  - 4 CI users with bilateral profound HL

Who’s at risk? CHL

This lack of relationship with degree of hearing loss is consistent with subjective fatigue data and suggests that children with even mild hearing loss are at increased risk for fatigue.

Age, Language, Nonverbal Intelligence, and Speech in Noise Recognition did not significantly accounted for variability in cognitive processing changes associated with listening-related fatigue.

Gustafson, 2015
Factors Influencing Fatigue in CHL

- What factors may modulate fatigue in CHL?
  - Hearing loss?
  - Intelligence? (TONI)
  - Language levels? (CELF)
  - Receptive vocabulary levels? (PPVT)
