Overview

Community Health research engages communities and speeds the adoption, integration, implementation, and evaluation of policies and practices to improve population health.

Global Health research focuses on underserved populations in low- and middle-income countries as well as foreign-born populations in the United States.

“The Community and Global Health Area provides a very wide range of research opportunities within global communities abroad and in Tennessee, and all Tennessee-based communities regardless of national origin. While most community research and much global health research is population-based, global health research also accommodates the entire spectrum of research from basic science to implementation science. Please reach out to us if you have any interest in these areas, and we will connect you with investigators who will mentor you for an outstanding research experience.”
