General Information

Short summary:
An Italian SME based in Northern Italy and founded in 2014, part of a group with a strong expertise in the manufacture, sale, and installation of glass systems.
The SME is quickly growing and becoming a benchmark in the sector of glass and aluminium balustrades for interiors and exteriors, both in Italy and internationally. It is looking for potential partners, glaziers, aluminium distributors, general contractors, window and door suppliers, installers and architecture studios.

Full description:
The Italian SME, based in Lombardy and active in the sector of balustrades since 2014 as a spin-off from a consolidated group, is one of the most prominent firms for the design and manufacture of patented glass and aluminium balustrades. The SME wants to propose two of its key products, in particular:
1) balustrades that can ensure optimum safety in building design in new constructions and renovations. They are available with or without handrails in various architectural and chromatic combinations, according to a configurable system. This solution, which has been tested by accredited laboratories, is made up of several pieces (profile, fastening system, casing, laminated and tempered glass), all of which are designed to ensure ease of assembly and an aesthetic outcome.
The casings are anodized for a finish with attractive and, above all, protective features that can endure exposure to hostile urban or marine environments. The anodization on the profiles is 20 microns. The casings are offered in distinct finishes, with options for smoky features in the various colors or painting to RAL tables.
The system can accommodate various thicknesses of laminated and tempered glass, all of which have been tested to withstand dynamic impact. The finished product is available in a variety of chromatic combinations and surface treatments, including float, low-iron, smoky, bronze, and a variety of other hues, screen-printed with full or partial covering or tinting to ensure privacy. Each solution can be paired with the usage of LEDs to produce a particularly pleasing lighting effect.
It has completed laboratory tests for dynamic and static loads up to 4.5 kN/m (with a thrust of up to 300 kg/m).
2) a latest-generation parapet with a modern design, suitable for all types of condo facade renovations as well as new constructions. It is intended for rapid and easy on-site installation, thanks to numerous technical advantages for installers.
There are two variants available: one that is built on top of the paving and one that is fastened to the front of the floor. The load resistances in the standard or adjustable version are 200 kg/m or 300 kg/m depending on the distance between the uprights and on the kind of anchorage.
Each system utilizes aluminum components with highly protective finishes and powder coating to ensure maximum resistance to external atmospheric agents.
This technology employs laminated glass that has been dynamically tested to ensure optimal safety.
The finished product is available in a variety of chromatic combinations and surface treatments, including float, low-iron, smoky, bronze, and a variety of various colors, screen-printed with full or partial covering or tinting to ensure privacy. Another architecturally notable feature is the option for corner "glass-glass" continuity, which means to corner directly on the corner.
Furthermore, the glass sections can be protected with cleaner treatment, which significantly lowers cleaning and maintenance time while minimizing the collection of lime-scale and debris.
Laboratory studies have proven that this product can withstand dynamic and static loads of up to 4.5 kN/m (with a thrust of up to 300 kg/m).
The company is already successful in both domestic and international markets. The SME is seeking for new partners worldwide in order to expand its business, with the goal of establishing long-term business relationships. Potential partners can be glaziers, aluminium distributors, general contractors, window and door suppliers, installers and architecture studios.

Advantages and innovations
The technological advantages of the first proposed product are:
- system tested in accredited laboratories
- the surface discourages children from climbing on it
- quick and simple assembly
- noise reduction
- the profile facilitates water discharge
- only cleaning is required for upkeep
Aesthetic advantages include:
- maximum transparency for unique perspectives
- excellent lighting for the premises
- customization of casing and glass finishes and colors
- option to install led light strip

The following technological advantages apply to the second product, namely the latest generation parapet:
