

SAFETY MEETING QUIZ

Name:

Date:

Safety Topic: V2-101 Electrical Safety – Electrical Shock

1. Electric shock can occur when an individual comes in contact with one wire of a/an _____ circuit and the ground.
 - a. energized
 - b. insulated
 - c. de-energized
 - d. locked out

2. Electric shock occurs when the body becomes a part of an electric circuit as the electrical current enters the body at one point and leaves at another point.
 - a. True
 - b. False

3. An insulator, like _____, has a high resistance to electricity.
 - a. steel
 - b. sea water
 - c. copper
 - d. wood

4. The severity of the electrical shock depends on
 - a. the amount of current flowing through the body.
 - b. the current's path through the body.
 - c. the length of time the body remains in the circuit.
 - d. all of the above.

5. Low voltage always means low hazard.
 - a. True
 - b. False

SAFETY MEETING QUIZ

ANSWER KEY

Safety Topic: V2-101 Electrical Safety – Electrical Shock

1. Electric shock can occur when an individual comes in contact with one wire of a/an _____ circuit and the ground.
 - a. energized
 - b. insulated
 - c. de-energized
 - d. locked out
2. Electric shock occurs when the body becomes a part of an electric circuit as the electrical current enters the body at one point and leaves at another point.
 - a. True
 - b. False
3. An insulator, like _____, has a high resistance to electricity.
 - a. steel
 - b. sea water
 - c. copper
 - d. wood
4. The severity of the electrical shock depends on
 - a. the amount of current flowing through the body.
 - b. the current's path through the body.
 - c. the length of time the body remains in the circuit.
 - d. all of the above.
5. Low voltage always means low hazard.
 - a. True
 - b. False
