Bold in android

TextView bold text TextView widget displaying text in android app. We can also syntax TextView text using string ressource files. This first android app shows us how we can underline TextView text with bold, italic, normal and even notificational syntax. The android:textStyle attribute allows us to set the text style to normal, bold, or italic. we can combine this style by separating them using the keyboard pipe | Symbol. therefore, if we want to process TextView text boldly and italically, we need to set the android:textStyle attribute value to android:textStyle=blod|italic. Android:textStyle=normal|italic value display text italic, android:textStyle=bold value display text only bold and android:textStyle=normal defines textView text view as normal. This is very interesting that we can process the text part of the textView in bold, italic or underlined using string source files. The string source file allows us to declare a string source of the value containing HTML tags. so the final output shows the sleek text in the android app. strings.xml the source file is located under the res/values folder. In the following sample code, we provide a string key value pair name stylish_text and its value. stylish_text value of the key contains html tags that make some of the text bold, italic, and underlined. We can assign the string source as android:text=@string/stylish_text xml layout file. <LinearLayout xmlns:android= xmlns:tools= android:layout_width=match_parent android:layout_height=match_parent android:orientation=vertical android:layout_margin=25dp tools:context=context=. MainActivity> <TextView android:id=@+id/text_view1 android:text=TextView - Bold Text android:layout_width=match_parent android:layout_height=wrap_content android:textsize=30sp android:textstyle=bold android:background=#F1F111></TextView> <TextView android:id=@+id/text_view2 android:text=TextView - Bold and Italic Text android:layout_width=match_parent android:layout_height=wrap_content android:textsize=30sp android:textstyle=bold|italic android:background=#FFDD11></TextView> activity_main.xml <TextView android:id=@+id/text_view3 android:text=TextView - Bold and Normal Text android:layout_width=match_parent android:layout_height=wrap_content android:textsize=30sp android:textstyle=bold|regular android:background=#FFF111></TextView> <TextView android:id=@+id/text_view4 android :text=@string/stylish_text android:layout_width=match_parent android:layout_height=wrap_content android:textsize=30sp android:background=#25F5FF></TextView> </LinearLayout> res/values/strings.xml <?xml version=1.0 <string name=app_name>Benim</string> </resources> </resources> <string name=action_settings>Settings</string> <string name=stylish_text> Hello! innee. <i>How are you?</i> <u>Where is your mother?</u> </string>the following illustration shows the contents of the string source file and its loaction in the application file system. The following image displays the final output of this application. In this picture, we can see bold, italic and underlined text or part of the text that we define in the bildirimary syntax in our application. The following android sample application code shows us how we can program programally write TextView text at run time in a java file. The setTypeface() method allows us to set the font and style of text that should be displayed in a widget. Not all Font families have thick and italic derivatives. The geTypeface() method allows us to get the current font and style in which the text is displayed. We can define the font and font variant of the textview widget as setTypeface (Typeface.MONOSPACE, Typeface.BOLD_ITALIC) with the setTypeface() method. The setTypefce() method only thick, italic, and normal the textview text. does not support underlined text or any other formatting. If we want to program programally display bold and underlined text in an application, we need help from the setText() method. to do this, we must provide html tags with the text as a setText() method parameter. The setText() method can process html tags and display text formatted in the application. Another way to programally thicken TextView text in java code by using the style source file. We can put styles.xml res/values folder. then assign the style element and value to the style file. finally, we can apply any style from this style file to textview using the setTextAppearnce() method. The setTextAppearance() method allows us to adjust the text color, size, style, tip color, etc. from the specified TextAppearance source. <LinearLayout xmlns:android= xmlns:tools= android:layout_width=match_parent android:layout_height=match_parent android:orientation=vertical android:layout_margin=25dp tools:context=context=. MainActivity> <TextView android:id=@+id/text_view1 android:layout_width=match_parent android:layout_height=wrap_content android:textsize=30sp android:background=#DEB887></TextView> <TextView android:id=@+id/text_view2 android:layout_width=match_parent android:layout_height=wrap_content android:textsize=30sp android:background=#FFF8DC></TextView> <TextView android:id=@+id/text_view3 android:layout_width=match_parent android:layout_height=wrap_content android:textsize=30sp android:background=#B8860B></TextView> activity_main.xml <TextView android:layout_width=match_parent android:layout_height=wrap_content android:textsize=30sp android:background=#8FBC8F></TextView> <TextView android:id=@+id/text_view5 android:id=@+id/text_view5></TextView android:id=@+id/text_view5 > </LinearLayout> </LinearLayout> android:layout_height=wrap_content android:textSize=30sp android:background=#F0E68C /> <Button android:id=@+id/push_button android:text=Apply TextView Bold Text android:layout_width=wrap_content android:layout_height=wrap_content android:onclick=perform_action></Button> MainActivity.java package com.cfsuman.me.myapplication5; import android.graphics.Typeface; import android.support.v7.app.ActionBarActivity; import android.os.Bundle; import android.view.Menu; android.view.MenuItem; import android.view.View; import android.view.View; import android.text.Html; import android.widget.TextView; public class MainActivity ActionBarActivity { @Override-protected void onCreate (Bundle savedInstanceState) { super.onCreate(savedInstanceState); setContentView(R.layout.activity_main); } public void perform_action(View v) { TextView tv1 = (TextView) findViewById(R.id.text_view1); //set text style current font tv1.setTypeface(tv1.getTypeface(), Typeface.BOLD); tv1.setText(Bold text in current default font.); TextView tv2 = (TextView) findViewById(R.id.text_view2); the text style is bold and italic, and the font is monospace tv2.setTypeface(Typeface.MONOSPACE, Typeface.BOLD_ITALIC) set; tv2.setText(Bold and italic text in single space font.); TextView tv3 = (TextView) findViewById(R.id.text_view3); text style italic and font serif tv3.setTypeface(Typeface.SERIF, Typeface.ITALIC); tv3.setText(italic text in serif font with SetTypeface() method);; TextView tv4 = (TextView) findViewById(R.id.text_view4); Html code String str = Define a stringwith Hello! Innee, ne. <u><i>How are you?</i></u> android.text.Html class //set text style bold, italic, and bottom line html tag tv4.setText(Html.fromHtml(str)); TextView tv5 = (TextView) findViewById(R.id.text_view5); styles.xml set the source file tv5.setTextAppearance (this, R.style.BoldItalicText) text style; tv5.setText(Bold and italic text by style.xml source file.); } @Override public boolean onCreateOptionsMenu(Menu menu) { // Inflate menu; adds items to the action bar if this exists. getMenuInflater(R.menu.menu_main, menu); correctly return; } @Override general boolean onOptionsItemSelected(MenuItem item) { // Process bar clicks here. Action bar // As you specify a parent activity in AndroidManifest, it automatically processes clicks that it clicks on the Home/Up button, so.xml//. int id = item.getItemid(); noinspection SimplifiableIfStatement if (id == R.id.action_settings) { return true; } return super.onOptionsItemSelected(item); } } res/values/styles.xml <resources> <!-- Base application theme. --> <style name=AppTheme parent=Theme.AppCompat.Light.DarkActionBar> <!-- Customize your theme here. --> </style> <style name=BoldItalicText> <item </style> </resources> aşağıdaki resimde resimde location and content of source files. the following image displays the initial state of the second sample application. the following image displays the result of the second sample application. Programmatically.
