

What is NXT®?

NXT® is an open, standards-based platform that integrates health information from virtually any EHR or healthcare system into a single, HL7® FHIR®-based interoperable Universal Health Record. NXT® makes it easy to exchange and share data with providers, patients, and payers while enabling robust data analytics and population health insights.

Why use NXT®?

Real innovation in healthcare today requires far more data than legacy systems were built to manage. NXT® is a platform built on today's technology, integrating clinical and claims data in a common data model and delivering the ease of access, high availability, and security of a scalable, cloud-hosted software system. It is built from the core to promote data sharing and to make the aggregation and use of healthcare information easy and efficient.

NXT® provides an open API foundation for both applications and analytics. Provider-facing and patient-facing applications can be built on NXT®, along with a wide range of analytics and reporting tools, giving you data that is insightful, useful, and actionable.

NXT®:

- Utilizes relevant patient data for superior clinical outcomes
- Creates seamless data integration supporting multiple providers and all EHRs
- Services and supports all patient populations for comprehensive public health monitoring
- Delivers an open and interoperable platform using standards such as HL7® FHIR®
- Provides a secure, accredited, HIPAA-compliant cloud hosted environment
- Utilizes clinical and claims data to support comprehensive use cases
- Delivers insightful and accessible aggregated data to providers, patients, and payers to make sound clinical decisions

NXT® connects disparate systems and gathers data to empower organizations to drive sound clinical and business decisions.
