If you shop for a new TV, then no more search. TechRadar has brought together the largest, brightest and brightest TVs we have ever passed by our eyeballs. Top-performing TVs can be expensive, but you have to think of this as an investment that will bring value over many hours and years and benefit your entire family. Most TV ranges for 2020 haven't arrived yet, so many of the groups below are from 2019, but don't let that stop you. Intergenerational TV promotions tend to be small steps, so you won't miss out on a large amount by sticking to these models. Remember, all these TVs get software updates online anyway. Currently, you can choose to safely upgrade to one of these top-performing TVs currently on the market. Is it bigger and better? Check out our choice of the best 65-inch TVs at a glance: Samsung Q90R QLED QLED TVLG CX OLED SeriesBest 8K: Samsung Q950TS QLED TVBUDGET OLED: LG B9 OLEDSamsung Series Q80T QLED TVBest TVLastLast last year, Samsung Q9FN TV was the winning TV. Plaudits won galore for its features and image quality, not to mention the excellent, improved smart platform that came with the support of Bixby and Samsung SmartThings. However it was not ideal and there were legitimate complaints about the viewing angles and the aggressive domestic blackout system that crushed the details just above the black. It is clear that Samsung has taken these criticisms to the heart and directly addressed them in the Q90. The new model has a clearly superior viewing angle that holds its own against the OLED TV, and dims the local delivers deep black without losing shadow details. To that end, the new Ultra Black Elite filter is no less than a revelation, rejecting ambient light in a way that only reels belief. Q90 is able to present images that can compete directly with OLED, with natural colors, bright highlights, deep blacks, and well-defined shades. It can also surpass any OLED when it comes to HDR, with images that are often breathtaking in their details and dynamic range. In fact our only real criticism will be that, unlike some competition, the Q90 does not support Dolby Vision. But in all other respects the Samsung Q90 is an excellent new Samsung TV that takes QLED to another level. Read the full review: Samsung Q90R QLED TV (credit image: LG) and LG CX OLED is definitely the best OLED TV for 2020, and is well worth scraping the top of this list to the best TVs available today. Repeating on last year's LG C9 series, it may not seem all that is different to LG CX - and it is not. But by continuing the same luscious image quality and prominent smart webOS platform, with some recent updates such as HDMI 2.1 and A9 Gen 3 processor, it managed to outperform its predecessor. With a new 48-inch OLED TV now available also, the CX is a more flexible proposal for a variety of wallets and With slimline design and support for Dolby Vision and Atmos - along with built-in sound - it's a great choice of any size. LG is really looking to attract players with its 2020 range as well, with late entry in the gutter. Nvidia G-Sync support, and compatibility with 4K/120HZ gameplay for the next generation key unit. You won't get HDR10+ here, unfortunately, UK viewers will have to go without all of the fave catching up apps, but make no mistake - this is the best OLED TV for you in 2020.Read full review: LG CX OLED (credit image: Samsung) Samsung Q950TS represents the latest TV 8 K from the manufacturer, combining all the benefits of the Samsung Q900 8K screen last year with innovations first introduced 2019 flagship Samsung Q90 4K TV that hit the shelves earlier this year.Combined in one of the top-notch QLED TV, the new Samsung Q950 offers an 8K panel and improved image processing artificial intelligence, enhanced image processing artificial intelligence. In addition to wider viewing angles, Improved black filter and HDR performance setting standards. If all that is not enough, Samsung's smart TV platform is the most comprehensive on the market. So if you're looking for a state-of-the-art Samsung TV - and don't mind paying the highest dollar for it - the Q950TS should be on top of your shortlist. Read the full review: Samsung Q950TS 8K QLED (Credit Photo: LG) 55 inches: LG OLED55B9 | 65 inches: The cheapest OLEDRich colors for 2019 from LG OLEDRich and sharp details for other processingNo HDR10 +THE LG B9 OLED fulfillits promise - to give shoppers a cheaper way in the OLED world, with sharp contrast and bright colors that involve it. Inevitably there are some cutting corners to get there, and you don't get an excellent experience of C9 or E9 - while the B9 budget launch is delayed, and price cuts continue for more premium kits, i.e. this year's B series isn't quite the deal it was a few months ago. If The B9 is all your budget allows, the solid purchase process, although scrabble and saving for LG C9 OLED - and keeping an eye on Black Friday and Monday online sales - may be a better decision in the long run. (Credit image: Samsung) new for 2020, the Samsung Q80T QLED builds on the successes of previous models of brilliant HDR TV certainly worth checking out. The most notable feature is the incredibly low input lag, making the Q80T a great choice for players who want to play responsive, but the QLED screen will also make a public view of the fun worldwide. The Q80T is the cheapest 2020 Samsung TV to come with a full-range background set, meaning you'll get consistent brightness, though not some of the premium qualities of higher end kits - hence why land less on this list than last year's QLED Q90. It is also not quite as elegant as the Q950TS zero frame, with a thick body compared to other QLEDs this year You'll still get Samsung's latest Quantum 4K processor, bright HDR colors, and advanced smart TV features with Tizen. If you want more savings, too, Q70R QLED is the predecessor of this TV, and it will cost you a few hundred good dollars less than the new Q80T model (yes, it's a line of some products, and yes, the label is confusing). Read the full review: Samsung Q80T QLED TVHow to buy what TV technology is best? Which is the best LCD TV? Which screen is best for your living room? What is the difference between LCD and LED TVs? The answers are not always clear. In fact, buying a new TV can be exhausting even for tech savvy - there are plenty of brands, lots of features, lots of screen sizes, colors, technologies and flavors to choose from. So which is suitable for you, your family and your living space? In this guide, we'll guide you to everything you need to know about buying a new TV. What types of TV are there? There are a lot of different screen types out there, all of which work in different ways to produce the same results. Each technology has its own unique strengths and weaknesses so here are some basics to consider: LED TV: Directly LED these screens are reared by a set of light emitting diodes (valves) directly behind the screen. This allows local opacity - meaning that areas adjacent to brightness and darkness can be displayed more effectively - and significantly improves contrast. LED TVs are more energy efficient and are capable of wider colours than CCFL sets. Because of the maximum cost of installing these arrays of LEDs, cheaper TVs usually use led edge screens lit via direct LED screens or full array. LED TV: LED edge with these TVs, bulbs are fitted from the backlight along the edges of the panel. This arrangement provides radically slender screens and offers superior contrast levels for CCFL, but can't achieve the same image quality as directly lit LED sets. However, they come in much cheaper and that's why most LED TVs out there now use this technology. OLED TV backlighting is achieved on OLED (organic light emitting diode) by passing an electric current through a contrived and electric film. This technology produces much better colors and higher contrast, and enables screens to be extremely thin and flexible. This is the sacred cup display technology, LG, Sony, Philips and Panasonic have all adopted it in their main collections. Quantum Dot Quantum Dot is Samsung's big game in the LED TV space. However, the brand claims to be able to produce more colorful images from LG and Sony while offering brighter panels. LG Super UHD TVs all use variation of quantum point called nano cell, and Hisense makes a number of quantum point TVs for US TELEVISION and Sum.Curved some manufacturers are still making TVs that have slightly curved screens. But unlike old CRT TVs, the curve inward instead of outside. The idea is that this makes each pixel equal lyfrom your eyes, delivering a more satisfying image. However, there are drawbacks to this type of screen, the most important of which is that if you sit far enough to one side - more than 40 degrees or so - the curve clearly begins to affect the geometry of the image, the content that decreases near you and the pressure of the image center. What decision technique should I go for? High-resolution TVs come in two resolutions. Sets with ready HD are required to be able to display a minimum 720p image, and generally has a screen resolution of 1366 x 768 pixels. Meanwhile, full HD TVs have a higher resolution of 1920 x 1080p. It is highly recommended that you do not go for anything less than full HD in this day and age. Ultra hd and 4K HD resolution is four times higher than full HD - 3840 x 2160. This means a much more detailed image, with content that requires a lot of bandwidth and storage space. 4K TVs tend to be good at upgrading HD video to Ultra HD but there are currently very few options to watch original 4K content. Read more about 4K.8K resolution if 4K isn't enough to convince you, there are now an unimpeachable number of 8K TVs entering the market. This super-ultra-high-definition shape packs in four times the number of pixels as 4K, for clearer, crisper images. The difficulty is that there is little 8K content available - nothing on Netflix, for example! This means that these kits need highly advanced processing to make HD or 4K content for 8K screens, and although it is not a technology to be purchased, it is certainly where the TV market goes. Read more about 8K resolution. Switching to HDR HDR video can make a more dramatic difference in the viewing experience from the transition from HD to 4K. Like still HDR images, the mobile version expands both light and dark ends of the spectrum, providing more detail for both. HDR needs new imaging methods though - at the moment there is no way to fill HDR in the current video. It also needs new TV technology, with Samsung the only one to create specific screens, although LG and Sony will be able to update some of their current shares to be compatible. Buying a flat-screen TV is one big investment that you can't take a little bit. Just appeared in the nearest store and grab the first plasma or LCD that you see will not get the best deal, the screen that suits your needs, or the gear you need to make the most of the new purchase. The size of mattersPeople tend to choose the size of the flat TV based on the amount of space they have for it, and that's not necessarily wise. Flat-screen TVs take up much less space than you might think, so your new TV may end up a foot or two away from viewing mode, making the image look smaller. Also, with Hello Dave, you could have the biggest screen The distance watch the same without worrying about seeing the inherent defects in the source. No noise in a 4K TV means that the ideal distance to sit from the screen is three to four times the height of the TV. How big should I buy tv? How many HDMI plugs do I need? For a living room TV you should look for at least 3 HDMI input. If you want to attach a set-top box as well as games etc keyboards, these HDMI ports will fill up quickly. (Credit: iStock) Do I want to hang my TV on the wall? First, you'll need to consult a construction expert to check that the wall in question is strong enough to support a flat screen. Then find out if the set is designed to want to be wall-mounted, and if so, ask if the relevant bracket is included in the basic package or as an optional additional. Am I going to tie it to a home cinema? If the answer is no, you may want to think more carefully about your audio performance set. Look for a screen that can go as loud as you'll need without distortion or rattle cabinet. Consider how dialogue looks and how low the end of the bass rumble is capable of. On the contrary, it is pointless to pay more money to exceptional built-in speakers if you already have a decent home cinema system. Other purchasing guides to check out
