

Sunless Spray Tanning Agreement

- Using pre-approved sunless prep & maintenance products are essential to the spray tanning process. I understand that I should use these products in order to achieve the best results.
- I understand that using bar soap or body wash that is not specified for sunless tanning can possibly strip away my sunless tan.
- DHA (sunless tanner) is clear and can take up to 24 hours to fully develop. During this time it is important to refrain from moisture build up on the skin (swimming, rain, showering, sweating, massage & pedicures).
- If I must shower prior to the 24-hour waiting period then I must use a warm water rinse only (no body wash or soap) to freshen up. I am aware that this may lessen the overall results of my tan.
- I understand that the product being applied during my sunless application may contain “cosmetic bronzers” that are helpful in the application process. These “instant bronzers” WILL wash off during my first shower.
- Disposable undergarments, protective eye wear and nose filters have been made available during my spray tan session, if I choose to use them.

I understand the importance of the above steps and the information my technician has given me to achieve the perfect sunless spray tan.
