

I'm not robot

**Continue**

To 0, the number of reasons should contain crumbs and divisors. Example: 10/2, 30/3, 100/5 A rational number is a number that represents a ratio of two integers. The divisor should not be equal to zero. Rational numbers will end decimals, but irrational numbers will not end. An example of the reason number is 10/2, and for an irrational number is a famous mathematical value Pi ( $\pi$ ), which equals 3.141592653589..... Yes 0 is a reason number because it is an integer that can be written in any format, such as 0/1, 0/2, where b is a non-zero integer, it can be written in the format:  $p/q = 0/1$ . Therefore, we conclude that 0 is the number 7 reason, because it can be written in the form of a ratio, for example, 7/1.9 is the number of reasons, because it can be written in the form of a ratio such as 9/1. Rational, the number between 3 and 4 =  $1/2 (3+4) = 7/2$  7/2.
