VACCINES

Creating a net of safety for vulnerable populations through flu immunization

Monika make up only about 15 per cent of the population, but during the 2016-17 flu season, they accounted for 67 per cent of hospitalizations.

Anthony Quinn
Director of Public Affairs, CARP

Senior makes up only about 15 per cent of the population, but during the 2016-17 flu season, they accounted for 67 per cent of hospitalizations.

If people, including healthy adults, would get the flu vaccination, this would translate into better protection for vulnerable populations, such as seniors, says Dr. Jane Barratt, secretary general of the International Federation on Ageing. "Apart from protecting vulnerable populations, believes Dr. Barratt, "immmunization can have significant implications, not only for individuals as individuals but also for the population as a whole. "The flu and flu-related hospitalizations are a major health risk, especially for seniors," says Quinn. "We believe that when vaccines are recommended, it is important for making vaccinations part of a comprehensive health-care strategy. "We believe that when vaccines are recommended, it is important for making vaccinations part of a comprehensive health-care strategy."

WHEN GETTING IMMUNIZED IS AS EASY AS GOING TO THE PHARMACY

People who are wondering what kind of immunizations are available for their care plan and when best to receive them can talk to their pharmacist or their physician. In Canada, the National Advisory Committee on Immunization (NACI) recommends that "all individuals six months of age and older who do not have contraindications to the vaccine" should get immunized. In several provinces, residents considering the flu shot are an essential protection for the colder season, much as other home housing or bundling up in Canada Goose coats. Yet while cozy homes and jackets shield us from the cold, competitors and all over Canada go one step further – it’s easier to be immunized.

Anthony Quinn, director of Public Affairs at the Canadian Association of Retired Persons (CARP), is especially concerned about seniors, especially those over age 65, "as they are at higher risk. "It is important for making vaccinations part of a comprehensive health-care strategy."

If you remember when rock was young...
there's a flu vaccine specially designed for you.

**Fluzone High-Dose**
INFLUENZA VACCINE

As you get older, your immune response to influenza vaccines decreases.

FLUZONE High-Dose improves your immune response to influenza (also known as the flu) and has demonstrated better protection of adults over 65 against the flu than our standard dose flu vaccine.

In fact, FLUZONE High-Dose vaccine is significantly more effective than our standard dose vaccine in preventing the flu – 24.2% more effective.

Check with your insurance provider to see if you are covered.

---

**FLUZONE** High-Dose is a vaccine used to prevent influenza in adults 65 years of age and older. Influenza (or flu) is an infection caused by the influenza virus. Annual vaccination using the current vaccine is recommended for prevention against influenza in immunity decline in the year following vaccination. Persons with a history of severe allergic reactions to eggs or egg products or any component of FLUZONE High-Dose should not receive the vaccine. FLUZONE High-Dose will only protect against the strains of influenza virus contained in the vaccine and those that are closely related. FLUZONE High-Dose will not protect against any other strains of influenza virus. FLUZONE High-Dose is not indicated for the prevention of hospitalization or death after the onset of disease. As with all vaccines, FLUZONE High-Dose does not protect 100% of people immunized. Allergic reactions can occur. The most common side effects are pain at the injection site and muscle ache. Contact your healthcare provider to see if this vaccine is right for you.
